

BINARY CODE WEARABLE

[illegible]

Have you ever looked inside a **computer**? It is full of wires that move **electricity** around, sending signals to turn things **on** and **off**. Computers speak a **different language** than we do, because they understand only two signals, on and off, like a light switch. That language, also called code, is called **binary**.

Each of the 26 letters in the alphabet is translated into eight on and off signals, called bits, that tell the computer what to do.
